SCM ERP — Release 1.0.8

Change Log & Test Guide | Previous version: 1.0.7 | Date: 18-Aug-2026

1. WHAT'S NEW IN 1.0.8

Module	Change
Procurement	**New module.** Full purchase chain now live: Material Request → Purchase Requisition → RFQ to vendors → vendor quotes → award → Purchase Order. Includes vendor portal for quoting and bulk approval of requisitions.
Logistics	**New module.** Outward leg end to end: Consignments → Dispatch → Transport Request → Tracking → Acknowledgement → Exceptions. Carrier vendors get a portal login to quote and confirm the trip; delivery is marked by the carrier, acknowledgement by the receiving site.
Warehouse	**Auto data fetch from PO** during material inward. Gate Entry, GRN and QC now pull item, quantity, UOM and vendor straight from the selected Purchase Order instead of manual typing.
Indents	**Approval status now shows the approver's role/rank** on the indent status badge, so the pending stage is visible at a glance instead of a plain "Pending Approval".
Settings	**New Approvals Flow screen.** Admin can configure who approves which document type, per project, by picking role rungs. Also adds Logistics Vendors screen for carrier partners and their portal logins.

2. TEST GUIDE

Setup: log in as *admin*, then use the role logins (procurement, store, approver, requester) for each step.

A. Settings — Approvals Flow

1. Settings > Approvals Config. Pick a document type and project.
2. Switch on one or two role rungs, save.
3. Raise a new indent — it must land with the role you switched on.
4. Change the ladder again; documents already in approval must NOT move.

B. Indents — role on status

1. Submit an indent as *requester*.
2. Check the list and detail screen: the status badge must name the approver's role and the person waiting.
3. Approve one level; the badge must move to the next role.

C. Procurement (new)

1. Approve an indent so a Material Request appears.
2. Create a Purchase Requisition from it, approve it.
3. Raise an RFQ, pick 2+ vendors, send.
4. Log in to the vendor portal, submit a quote from each.
5. Compare quotes, award one — a PO must be created with the awarded rate.
6. Send the PO to the vendor.

D. Warehouse — auto fetch from PO

1. Material Inward > Gate Entry. Select the PO number.
2. Vendor, items, quantities and UOM must fill in on their own; only vehicle/challan is typed.
3. Create the GRN from that gate entry — lines must carry over, no re-entry.
4. Enter a short receipt quantity; the PO balance must reduce by the received quantity only.
5. Run QC: pass some, reject some. Passed quantity moves to stock, rejected does not.
6. Check Stock Balance and Stock Ledger for the passed quantity.

E. Logistics (new)

1. Settings > Logistics Vendors: add a carrier and issue its portal login.
2. Warehouse packs and releases a consignment.
3. Logistics > Dispatch: pick the consignment, write the gate pass, choose mode and provider, confirm once.
4. Own vehicle / hired mode → goes straight to READY.
5. Third party → goes to the carrier portal for a price. Accept the quote, then confirm the carrier's acceptance — only then READY.
6. Carrier portal: mark In Transit, then Delivered.
7. Receiving site: acknowledge. Try a short/damaged receipt — it must raise an entry on the Exceptions desk.

> **Watch for:** a carrier must never be able to set "Acknowledged"; the receiving site must never be able to set "Delivered"; and every document must still point back to the one before it (PO→Indent, GRN→PO, Transport→Consignment).
